

NETWORK SECURITY

You can rely on IT.

Staying ahead of cybersecurity threats can be a challenging, full-time job. That's why TelWare offers a wide range of solutions and integrations, designed to reduce the risk of external attacks, with protection of user accounts and endpoints. Our solutions will help to protect against the wide variety of security threats and protect your sensitive information.

An effective network-security solution will allow employees to work securely from any location. Clients and consumers will have confidence that their sensitive information is protected. Should a security breach occur, there will be little fallout as a result and recovery time will be minimal.

HEALTH OF YOUR NETWORK

Network monitoring is the first step toward proactive security and maintenance, while also improving reactive response times. We provide support that is remote, efficient and non-intrusive. At TelWare, our mission is to support your success through network monitoring.

We will oversee the operation of your network and ensure the availability and performance of all hosts and network services. TelWare can find and mend small problems before they develop into larger problems that have a negative impact on the entire network. Many unmonitored systems will have warning signs that could be discovered prior to a critical issue arising. Sometimes, an unmonitored backup system will have an excessive number of failed backups. Other times, an antivirus system hasn't been updated in weeks. Small problems like these, if unnoticed and unchecked, can develop into much larger problems that will be detrimental to the network.
